### **CHAPTER 3 Inductively Coupled Plasma Atomic Emission**

In inductively coupled plasma atomic emission spectroscopy (ICP), the sample is vaporized and the element of interest atomized in an extremely high temperature ( $\approx 7000^{\circ}\text{C}$ ) argon plasma, generated and maintained by radio frequency coupling. The atoms collide with energetically excited argon species and emit characteristic atomic and ionic spectra that are detected with a photomultiplier tube.

Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP-AES) Inductively coupled plasma atomic emission spectroscopy (ICP-AES) employs the use of inductively coupled plasma for producing excited ions and atoms that radiate electromagnetically charged particles at wavelengths characteristic to a definite element.

An inductively coupled plasma (ICP) or transformer coupled plasma (TCP) is a type of plasma source in which the energy is supplied by electric currents which are produced by electromagnetic induction, that is, by time-varying magnetic fields.

Inductively coupled plasma-atomic emission spectrometry (ICP-AES) is used to determine metals and some nonmetals in solution. This method is a consolidation of existing methods for water, wastewater, and solid wastes.
